```

The flowchart illustrates a process for handling a service request from a mobile device. It begins with receiving a request at a receiving center (200), which is then sent to a service server (210). The service server processes the request (110) and interacts with a transaction server (130) to complete the transaction. The service server then sends a confirmation message (145) and data for the service (140) to the printing server. The printing server processes the service data, printer information, and stored data (170) to generate print data. Finally, the print data is sent to the mobile device for printing (180). The process also involves obtaining printer information (150) and using stored data (175) to format the print data.
